

IN2009

Language Processors

Weeks 4 & 5

Parsing II (abstract syntax)

Christian Cooper

Session Plan

Session 4: Parsing (abstract syntax)

Covered in weeks 4 and 5.

- MiniJava introduction and parsing
- Lookahead
- JavaCC grammars and semantic actions and values
- Simple expression evaluator
- Abstract syntax trees

11th February, 2008

N2009 Language Processors - Weeks 4 & 5

Session Plan

- Using semantic actions to build abstract syntax trees
- Interpreting the trees
- Visitors
- MiniJava abstract syntax trees in Java
- JavaCC for generating MiniJava abstract syntax trees

11th February, 2008

N2009 Language Processors - Weeks 4 & 5

MiniJava

• A subset of Java – example program:

```
class Factorial {
    public static void main(String[] a) {
        System.out.println(new Fac().ComputeFac(10));
    }
}

class Fac {
    public int ComputeFac(int num) {
        int num_aux ;
        if (num < 1)
            num_aux = 1 ;
        else
            num_aux = num * (this.ComputeFac(num-1)) ;
        return num_aux ;
    }
}</pre>
```

MiniJava Grammar I

```
Program → MainClass ClassDecl*

MainClass → class id
{ public static void main ( String [] id ) { Statement}}

ClassDecl → class id { VarDecl * MethodDecl * }

ClassDecl → class id extends id
{ VarDecl * MethodDecl * }

VarDecl → Type id ;

MethodDecl → public Type id ( FormalList )
{ VarDecl * Statement* return Exp; }
```

MiniJava Grammar II

```
FormalList \rightarrow Type id FormalRest*
FormalList \rightarrow

FormalRest \rightarrow , Type id

Type \rightarrow int []
Type \rightarrow boolean
Type \rightarrow int
Type \rightarrow id
```

MiniJava Grammar III Statement → { Statement * } → if (Exp) Statement else Statement → while (Exp) Statement → System.out.println (Exp); → id = Exp; → id [Exp] = Exp; ExpList → Exp ExpRest * ExpList → ExpRest → , Exp

```
MiniJava Grammar IV
Exp \rightarrow Exp \ op \ Exp
Exp \rightarrow Exp [Exp]
Exp \rightarrow Exp . length Exp \rightarrow Exp . ld (ExpList)
Exp → INTEGER_LITERAL
Exp \rightarrow true
Ехр
      → false
Exp \rightarrow id
                                                  ambiguous?
Exp \rightarrow this
Exp \rightarrow new int [Exp]
Ехр
      \rightarrow new id ()
Exp \rightarrow ! Exp
      \rightarrow (Exp)
Ехр
```

```
MiniJava JavaCC example

Program → MainClass ClassDecl*

MainClass → class id { public static void main (String [] id)
{ Statement}}

void Goal():
{}

MainClass()
( ClassDeclaration())*

<EOF>
}

void MainClass():
{}

"class" Identifier() "{"
"public" "static" "void" "main" "(" "string" "["
"public" "static" "void" "j" Identifier() ")"

"{" Statement() "}"

"}"

N2009 Language Processors - Weeks 4 & 5
```

```
Local Lookahead
                             \rightarrow \{ \text{ Statement * } \}   \rightarrow \text{ if } ( \text{ Exp } ) \text{ Statement else Statement} 
         Statement
         Statement
                            → while ( Exp ) Statement
                            → System.out.println ( Exp );
         Statement
                            Statement
         Statement
                                    void AssignmentStatement() :
void Statement() :
{}
                                       Identifier() "=" Expression() ";"
  Block()
                                    void ArrayAssignmentStatement() :
  AssignmentStatement()
                                      Identifier() "[" Expression() "]" "="
  ArrayAssignmentStatement()
                                                               Expression() ";"
                                    }
     11th February, 2008
                                    inguage Processors - Weeks 4 & 5
```

```
void AndExpression() :
{}
{
    PrimaryExpression() "&&" PrimaryExpression()
}

void ArrayLength() :
{}
{
    PrimaryExpression() "." "length"
}

void MethodCall() :
{}
{
    PrimaryExpression() "."
Identifier()
    "(" ( ExpressionList() )? ")"
}

void PrimaryExpression() :
{}
{
    IntegerLiteral()
    |
    FalseLiteral()
    |
    Identifier()
    |
```

Semantic actions

- Each terminal and non-terminal associated with own type of semantic value.
- Terminal (token) semantic values are the tokens returned by the lexical analyser (type Token in JavaCC).

11th February, 2008

12009 Language Processors - Weeks 4

Semantic actions

- Non-terminals semantic values are given depending on what you want the rules to do.
- Semantic action for rule $A \rightarrow B C D$
 - returns type associated with A
 - can build this from values associated with B, C, D
- JavaCC allows us to intersperse actions within rules (written in {...})

11th February, 2008

IN2009 Language Processors - Weeks 4 & 5

Example: simple expression evaluator

```
int T():
TOKEN:
                                                       { int t; int f; }
  < NUM: (["0"-"9"])+ > | < EOL: "\n" >
                                                         t=F() ( "*" f=F() { t=t*f; }
| "/" f=F() { t=t/f; } )*
int S()
                                                          { return t; }
   s=E() <EOL> { return s; }
                                                       int F():
   <FOĬ
 |<EOF>
                                                        { Token t; int result; }
                                                          t=<NUM>
int E():
                                                               { return Integer.parseInt(t.image); }
{ int e; int t; }
                                                         | "(" result=E() ")"
                                                               { return result; }
 e=T() ( "+" t=T() { e=e+t; }
| "-" t=T() { e=e-t; } )*
{ return e; }
} 11th February, 2008
```

JavaCC actions

```
non-terminals can deliver values

we can declare some variables to use in actions

we can assign to variables from terminals and non-terminals

int E():

{ int e; int t; }

we can write any Java code in actions

{
e=T() ( "+" t=T() { e=e+t; }

| "-" t=T() { e=e-t; } )*

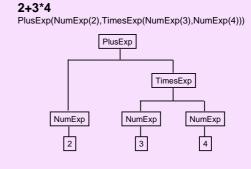

{ return e; }
}

this is where the non-terminal value is delivered
```

Abstract syntax trees

```
Abstract syntax for expressions
 E \rightarrow E * E | E / E | E + E | E - E | num
package syntaxtree;
                                                                 E
public abstract class Exp {}
public class NumExp extends Exp {
                                                            Е
                                                                       Е
                                                num
 private String f0;
 public NumExp (String n0) { f0=n0; }
                                                           num
                                                                       num
public class PlusExp extends Exp {
                                                     num+num*num
 private Exp e1, e2;
 public PlusExp(Exp a1, Exp a2) { e1=a1; e2=a2; }
                        IN2009 Language Processors - Weeks 4 & 5
```

Abstract syntax tree representation

Actions to create abstract syntax trees

```
Exp S():
                                               Exp T():
                                                { Exp t; Exp f; }
 { Exp s; }
                                                t=F() ( "*" f=F() { t=new TimesExp(t,f); } 
| "/" f=F() { t=new DivideExp(t,f); } )*
    s=E() <EOL> { return s; }
  |<EOF>
                                                   { return t; }
Exp E():
                                                          Exp F():
{ Exp e; Exp t; }
                                                          { Token t; Exp result; }
 e=T() ( "+" t=T() { e=new PlusExp(e,t); }
| "-" t=T() { e=new MinusExp(e,t); } )*
                                                              t=<NUM> { return new
                                                                            NumExp(t.image); }
   { return e; }
                                                              "(" result=E() ")" { return result; }
```

package syntaxtree; public abstract class Exp { public abstract class Exp { public abstract int eval(); } public class NumExp extends Exp { private String f0; public NumExp (String n0) { f0=n0; } public int eval() { return Integer.parseInt(f0); } public val() { return lesser.parseInt(f0); public int eval() { return lesser.parseInt(f0); public int eval() { return lesser.parseInt(f0); public val() { return lesser.parseInt(f0); public class PlusExp extends Exp { private Exp e1, e2; public PlusExp(Exp a1, Exp a2) { e1=a1; e2=a2; } public int eval() { return e1.eval()+e2.eval(); } }

root = parser.S();

System.out.println("Answer is "+root.eval());

Main.iava

b Fabruary 2000

JavaCC parsers and actions

- Normally, the JavaCC grammar has semantic actions and values that are suited to creating the abstract syntax tree
 - the parser returns the root of the abstract tree when the parse completes successfully (here, S() returns a reference to the root object which is of class Exp)

11th February, 2008

IN2009 Language Processors - Weeks 4 & 5

JavaCC parsers and actions

- With the expression language, we simply wrote an eval method to calculate the value; this is not usual...
- Instead, further methods are written that traverse the abstract tree to do useful things
 - typechecking
 - code generation
 - etc

11th February, 2008

N2009 Language Processors - Weeks 4 & 5

A better way to traverse the tree

- "Visitor pattern"
 - Visitor implements an interpretation.
 - Visitor object contains a visit method for each syntax-tree class
 - Syntax-tree classes contain "accept" methods
 - Visitor calls "accept" (what is your class?). Then "accept" calls the "visit" of the visitor

11th February, 2008

IN2009 Language Processors - Weeks 4 & 5

Visitors

- Allow us to create new operations to be performed by tree traversal without changing the tree classes
- Visitors describe both:
 - actions to be performed at tree nodes, and
 - access to subtree objects from this node

11th February, 2008

IN2009 Language Processors - Weeks 4 & 5

Tree classes with accept methods for visitors

```
package syntaxtree;
import visitor.*;

public class PlusExp extends Exp {
  public Exp e1, e2;
  public abstract class Exp {
  public abstract int accept(Visitor v);
  }

public class NumExp extends Exp {
  public String f0;
  public NumExp extends Exp {
  public NumExp (String n0) { f0=n0; }
  public int accept(Visitor v) {
  return v.visit(this);
  }
}

11th February, 2008

N2009 Language Processors - Weeks 4 & 5
```

package visitor; import syntaxtree.*; public interface Visitor { public int visit(PlusExp n); public int visit(MinusExp n); public int visit(TimesExp n); public int visit(NumExp n); public int visit (MinusExp n) { return n.e1.accept(this)+n.e2.accept(this); } public int visit (DividExp n) { return n.e1.accept(this)*n.e2.accept(this); } public int visit (DividExp n) { return n.e1.accept(this)/n.e2.accept(this); } public int visit (NumExp n) { return n.e1.accept(this)/n.e2.accept(this); } public int visit (NumExp n) { return n.e1.accept(this)/n.e2.accept(this); } } Main.java root = parser.S(); System.out.println("Answer is" +root.accept(new Calc())); 11th February, 2008

What you should do now...

- · Read and digest chapter 4
- Look at MiniJava JavaCC definition for examples of lookahead
- Understand visitors
- Get ready to modify JavaCC specifications, and abstract syntax tree definitions, for coursework.
- Practice RegExps!

11th February, 2008 IN2009 Language Processors - Weeks 4 & 5 42

What you should do now...

- Read and understand about MiniJava and its abstract syntax trees and visitors
- (By the start of week 7) Begin the **second** coursework.

11th February, 2008

12009 Language Processors - Weeks 4 & 5

Schedule

- This session continued
- Monday 18th February, 2008
 - 11:00 12:50
 - -C.348

Week 6 is a reading week!

- Semantic Analysis
- Monday 3rd March, 2008
 - 11:00 12:50
 - C.348

11th February, 2008
