

Session Plan

Session 4: Parsing (abstract syntax)

- MiniJava introduction and parsing
- Lookahead
- JavaCC grammars and semantic actions and values
- Simple expression evaluator
- Abstract syntax trees
- Using semantic actions to build abstract syntax trees

d February, 2009 Session 4

Session Plan

- Interpreting the trees
- Visitors
- MiniJava abstract syntax trees in Java
- JavaCC for generating MiniJava abstract syntax trees
- Coursework 2.
 Released next week (check CitySpace)
 Due: 20 March

23rd February, 2009 Session 4

MiniJava

• A subset of Java – example program:

```
class Factorial {
   public static void main(String[] a) {
       System.out.println(new Fac().ComputeFac(10));
   }
}

class Fac {
   public int ComputeFac(int num) {
       int num aux ;
       if (num < 1)
            num aux = 1 ;
       else
            num aux = num * (this.ComputeFac(num-1)) ;
       return num_aux ;
   }
}</pre>
```

MiniJava Grammar I

```
Program → MainClass ClassDecl *

MainClass → class id { public static void main ( String [] id ) { Statement}}}

ClassDecl → class id { VarDecl * MethodDecl * } 
ClassDecl → class id extends id { VarDecl* MethodDecl * } 
VarDecl → Type id ; 
MethodDecl → public Type id ( FormalList ) 
{ VarDecl * Statement* return Exp; }

2/10 February, 2009 
Session 4 
5
```

MiniJava Grammar II

```
FormalList \rightarrow Type id FormalRest *
FormalList \rightarrow

FormalRest \rightarrow , Type id

Type \rightarrow int []
Type \rightarrow boolean
Type \rightarrow int
Type \rightarrow id
```

MiniJava Grammar III Statement → { Statement * } → if (Exp) Statement else Statement → while (Exp) Statement → System.out.println (Exp); → id = Exp; → id [Exp] = Exp; ExpList → Exp ExpRest * ExpList → ExpRest → , Exp

```
MiniJava Grammar IV
        → Exp op Exp
                                                    * - + > 33
Exp
       \rightarrow Exp [Exp]
Exp
        → Exp . length
Exp \rightarrow Exp . Id (ExpList)

Exp \rightarrow INTEGER\_LITERAL
Ехр
      → true
Exp \rightarrow false
Exp \rightarrow id
                                                      ambiguous?
      \rightarrow this
Ехр
Exp \rightarrow \text{new int } [Exp]
Exp \rightarrow \text{new } id \text{ ( )}
Exp \rightarrow !Exp
Exp \rightarrow (Exp)
```

MiniJava JavaCC example Program → MainClass ClassDecl* MainClass → class id { public static void main (String [] id) { Statement}} void Goal(): {} { MainClass() (ClassDeclaration())* <EOF> } void MainClass(): {} { "class" Identifier() "{" "public" "static" "void" "main" "(" "String" "[" ""]" Identifier() ")" "}" "{" Statement() "}" "Statement() "}"

```
Local Lookahead
       Statement
                       → { Statement * }
                       → if (Exp) Statement else Statement
→ while (Exp) Statement
        Statement
        Statement
                       Statement
       Statement
                              void AssignmentStatement() :
void Statement() :
                                Identifier() "=" Expression() ";"
                              void ArrayAssignmentStatement() :
{}
 LOOKAHEAD (2)
 LOOKAHEAD (2)
                               Identifier() "[" Expression() "]" "="
 ArrayAssignmentStatement()
                                                    Expression() ";"
```

Semantic actions

- Each terminal and non-terminal associated with own type of semantic value.
- Terminal (token) semantic values are the tokens returned by the lexical analyser (type Token in JavaCC).

23rd February, 2009 Session 4

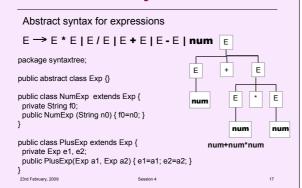

Semantic actions

- Non-terminals semantic values are given depending on what you want the rules to do.
- Semantic action for rule $A \rightarrow B C D$
 - returns type associated with A
 - can build this from values associated with B, C, D
- JavaCC allows us to intersperse actions within rules (written in {...})

3rd February, 2009 Session 4 14

Example: simple expression evaluator

Abstract syntax trees

Abstract syntax tree representation 2+3*4 PlusExp(NumExp(2),TimesExp(NumExp(3),NumExp(4))) PlusExp NumExp NumExp NumExp 18

Actions to create abstract syntax trees

Using the abstract syntax tree

```
package syntaxtree;

public class PlusExp extends Exp {
    public abstract class Exp {
    public abstract int eval();
    }

public class NumExp extends Exp {
    public class NumExp extends Exp {
        private String f0;
    public NumExp (String n0) { f0=n0; }
    public int eval() {
        return Integer.parseInt(f0);
    }
}

Main.java

root = parser.S();
System.out.println("Answer is "+root.eval());
```

JavaCC parsers and actions

- Normally, the JavaCC grammar has semantic actions and values that are suited to creating the abstract syntax tree
 - the parser returns the root of the abstract tree when the parse completes successfully (here, S() returns a reference to the root object which is of class Exp)

23rd February, 2009 Session 4 21

JavaCC parsers and actions

- With the expression language, we simply wrote an eval method to calculate the value; this is not usual...
- Instead, further methods are written that traverse the abstract tree to do useful things
 - typechecking
 - code generation
 - etc

23rd February, 2009 Session 4

A better way to traverse the tree

- · "Visitor pattern"
 - Visitor implements an interpretation.
 - Visitor object contains a visit method for each syntax-tree class
 - Syntax-tree classes contain "accept" methods
 - Visitor calls "accept" (what is your class?). Then "accept" calls the "visit" of the visitor

23rd February, 2009 Session 4 23

Visitors

- Allow us to create new operations to be performed by tree traversal without changing the tree classes
- Visitors describe both:
 - actions to be performed at tree nodes, and
 - access to subtree objects from this node

23rd February, 2009 Session 4 24

Tree classes with accept methods for visitors package syntaxtree; import visitor.*; public abstract class Exp { public abstract int accept(Visitor v); } public class NumExp extends Exp { public String f0; public NumExp (String n0) { f0=n0; } public int accept(Visitor v) { return v.visit(this); } }

```
A calculator visitor
                                                                package visitor;
import syntaxtree.*;
 package visitor;
 import syntaxtree.*;
                                                                public class Calc implements Visitor {
  public int visit (PlusExp n) {
    return n.e1.accept(this)+n.e2.accept(this);
}
 nublic interface Visitor 8
  public int visit(PlusExp n);
public int visit(MinusExp n);
                                                                 public int visit (MinusExp n) {
  return n.e1.accept(this)-n.e2.accept(this);
   public int visit(TimesExp n);
   public int visit(DivideExp n):
   public int visit(NumExp n);
                                                                 }
public int visit (TimesExp n) {
  return n.e1.accept(this)*n.e2.accept(this);
                                                                 public int visit (DivideExp n) {
  return n.e1.accept(this)/n.e2.accept(this);
Main.java
                                                                 public int visit (NumExp n) {
  return Integer.parseInt(n.f0);
root = parser.S():
System.out.println("Answer is"
         +root.accept(new Calc()));
```

```
abstract Class Type

Formal FormalParameterRest():
{ Formal f; }
{ "," f=FormalParameter() { return f; } }
}
Session 4 41
```

What you should do now...

- · Read and digest chapter 4
- Look at MiniJava JavaCC definition for examples of lookahead
- · Understand visitors
- Get ready to modify JavaCC specifications, and abstract syntax tree definitions, for coursework.
- Practice RegExps!
- Read and understand about MiniJava and its abstract syntax trees and visitors

23rd February, 2009 Session 4 42
